

ABSTRACT OF THE DISCLOSURE

A data transmission device for allowing access from a remote unit to at least one automation device via a standard browser includes a data conversion unit connected between the remote unit and an automation device. The data conversion unit is capable of converting data between a first communication protocol and a second communication protocol. The data are exchanged between an automation device and the data conversion unit and between the automation devices themselves by using the first communication protocol. The data are then exchanged between the data conversion unit and the remote unit according to a second communication protocol.
